

# LPCTrap setup update

Xavier Fléchar

*LPC-Caen, ENSI-CNRS/IN2P3 and  
Université de Caen Basse-Normandie  
Caen, France*

DESIR collaboration meeting, Sept 2010, Manchester

- Decay source of radioactive ions confined in a transparent Paul Trap (electrostatic RF trap works for any singly charged ions)
- $\beta$  and RI detected in coincidence

*(previous design)*

- No ceramic (no charge up)
- Cylindrical symmetry

$KE_{ion}$ :

10 keV

100 eV - <1 eV

1 keV

100 eV 0 eV

$\Delta KE$ :

~20 eV

~1 eV

~0.1 eV

Efficiency:

$\epsilon \sim 10-15\%$  @  $T_{duty} = 20ms$

$\epsilon \sim 1-1.5\%$  @  $T_{duty} = 200ms$

$\epsilon \sim 40\%$

$\epsilon \sim 20\%$

## -RFQ electronics upgrade:

- RF adapted to higher masses (for  $^{35}\text{Ar}$ ,  $^{19}\text{Ne}$  beams at SPIRAL)
- Improved RF symmetry

## Tests with $^6\text{Li}^+$ and new Paul Trap

$$\epsilon_{\text{RFQ}} \sim 10\% @ T_{\text{duty}} = 80\text{ms}$$

$$\epsilon_{\text{line+trap}} \sim 20\% \text{ for RFQ bunches } < 10^6 \text{ ions}$$

$$\epsilon_{\text{total}} \sim 2\%$$

Up to 200 000 trapped ions for  $1.5 \cdot 10^8$  pps ( $^6\text{Li}^+$ )

Adding of acceleration electrode & longer field free region

→ Distributions separated by time of flight

→ Shake-off probability measurement

*Proposal (5% precision,  ${}^6\text{He}$ )  
accepted @ GANIL  
(scheduled in November 2010)*

- New beta detectors (replace silicon detector for position readout)
  - > speed up the data acquisition
  - > reduce back-scattering issues
- New detection chamber
  - > easier implementation of new detectors ( $\beta$  and  $\gamma$ ...)
  - > larger solid angle for particles detection
